

Enquiry-to-Service-Start Visibility Starter Kit

Make owner, status, next action, due date, exception and readiness decisions visible across one operational workflow.

What this helps you do

Start with a disability-provider enquiry-to-service-start path. Selected allied health practices can adapt the same fields for referral and appointment workflows without treating the template as a client-data store.

Companion workbook

Open **enquiry-to-service-start-starter-kit.xlsx** to enter ratings, use formulas and keep a working copy in an approved location.

Information boundary

Use general, synthetic or appropriately de-identified examples. Do not enter participant, patient, worker, clinical, credential or other personal or sensitive information into a public download or unapproved system.

Version 1.0 | 3 September 2026 | Australian English

WORKFLOW DESIGN

Build a minimum operational view

A useful tracker exists to support decisions and handovers. It should not become a duplicate record of participant, patient or clinical detail.

Minimum field	Decision it supports
Anonymous reference ID	Find the record without using a name or identifier in this starter file.
Stage	Show where the work is within the agreed start-to-end boundary.
Status	Use a small consistent set: New, In progress, Waiting, Ready for decision, Closed.
Owner role	Name one accountable role, not a team or inbox.
Next action	Write the next observable step, not 'follow up'.
Due date	Make ageing and delay visible using a real date.
Waiting on	Separate blocked work from active work without storing sensitive detail.
Readiness decision	Record Not assessed, Ready, Not ready or Not proceeding.
Decision owner	Name the authorised role that makes the relevant operational decision.
Exception and last update	Surface work outside the normal path and stale records.

Data-minimisation rule

If a field does not support an agreed decision, action, handover, control or measure, remove it. Store required source information only in the organisation's approved system.

STATUS GUIDE

Agree status definitions before launch

Stage	Operational meaning	Minimum exit condition
New enquiry	A high-level request entered the workflow.	Owner assigned and first review due.
Initial review	The request is checked against the approved process.	Safe next action and required high-level information are clear.
Information requested	The organisation is waiting for agreed information.	Receipt recorded or a closure or escalation decision made.
Options review	Operational options or fit are being considered.	Named decision and decision owner recorded.
Decision pending	An authorised person needs to decide the next route.	Decision and rationale recorded in the approved place.
Ready to commence	The organisation's own readiness condition is met.	Decision owner and commencement action recorded.
Commenced	The workflow moved into the agreed next stage.	Start recorded and remaining actions routed.
Closed / not proceeding	The record has a deliberate closure outcome.	Reason, owner and onward action recorded.

Readiness boundary

'Ready to commence' is an organisation-owned operational decision. This kit does not verify service, clinical, registration, audit, legal, privacy or regulatory readiness.

IMPLEMENTATION GUIDE

Set up the view, then test it

1	Define one boundary Name what starts the workflow, what closes it and which downstream activities are excluded.
2	Name the decisions For each stage, identify the decision, authorised owner, minimum evidence and next action.
3	Adapt the fields Remove fields that do not support a decision. Keep source and sensitive information in approved systems.
4	Create five synthetic records Test normal, waiting, overdue, exception and closed paths without using real client information.
5	Run one review Ask what is waiting, who owns it, what is due, which decision is blocked and what should close.
6	Choose the approved home Before real use, confirm purpose, access, storage, retention, deletion, support and backup ownership.

Review rhythm

- + Daily or event-driven: update owner, status, next action and due date when the work changes.
- + Weekly: review waiting, overdue, exception and decision-pending items.
- + Monthly: remove unused fields, check status consistency and review whether the view still supports the intended decisions.

WORKED EXAMPLE

Use synthetic records to test the design

Synthetic example - not a client tracker

The records below are fictional and contain no identifying or sensitive information. They demonstrate field use only.

Reference	Stage	Status	Owner role	Next action	Attention
SYN-001	New enquiry	New	Intake coordinator	Complete high-level review	On track
SYN-002	Information requested	Waiting	Intake coordinator	Check agreed information	Attention
SYN-003	Decision pending	Ready for decision	Operations lead	Record authorised route	Attention
SYN-004	Ready to commence	In progress	Service coordinator	Confirm commencement action	On track
SYN-005	Closed / not proceeding	Closed	Intake coordinator	None - outcome recorded	On track

Five review questions

- + What is waiting, blocked, overdue or exceptional?
- + Does every open record have one owner and one next action?
- + Which decision is due, who can make it and what evidence is missing?
- + Are status definitions being applied consistently?
- + What should close, be corrected or be escalated before the next review?

SERVICE BRIDGE

Know when a template is no longer enough

What you learn	Possible next step	Boundary
The workflow boundary, root cause, measures or feasible design are still unclear.	Heutrix Diagnostics may help define the problem and produce a decision-ready implementation brief.	A paid Diagnostic can still recommend no build.
The tracker exposes recurring integration, permission, handover or adoption gaps in one bounded workflow.	A Heutrix Workflow Transformation scope may be worth discussing.	No integration, system, timing or outcome is promised before feasibility and written scope.
The template works in the approved existing system.	Keep it, document ownership and review it periodically.	A custom build is not required.
Real information handling is not approved.	Stop before use and confirm purpose, access, storage, retention, deletion and incidents.	The template is not an approved client-data store.

Initial conversation

Talk to Heutrix: a 20-minute introductory conversation about one high-level workflow.
Keep it general. Do not include sensitive records. Any paid work is agreed separately.
